

TABLE OF CONTENTS

1. INTRODUCTION	1
1.1 Scope of the Report.....	1
1.2 Considerations on the Seismic Analysis of Concrete Dams.....	2
1.2.1 The Importance of the Right Model.....	2
1.2.2 The Limitations and Benefits of Linear Analysis	2
1.2.3 Load Combinations.....	3
2. NUMERICAL MODELING	5
2.1 Introduction.....	5
2.2 Numerical Modeling Methods	
2.2.1 Implicit vs. Explicit Formulations	5
2.2.2 Response-Spectrum vs. Time History Solutions	8
2.2.3 Linear vs. Non-Linear Models.....	11
2.3 General Modeling Considerations	15
2.3.1 Two vs Three Dimensional Modeling	15
2.3.2 Damping.....	15
2.3.3 Spatial Variation of Ground Motion.....	16
2.3.4 Reservoir Hydrodynamics	16
2.3.5 Damage Accrual.....	16
3. EARTHQUAKE INPUT	19
3.1 Specification of Ground Motion and Performance Criteria.....	19
3.2 Ground Motion Characteristics.....	19
3.3 Application of Seismic Input to the Numerical Model.....	22
4. RESERVOIR WATER MODELING ISSUES	23
4.1 General.....	23
4.2 Water Interaction Models	23
4.2.1 Standard Westergaard Method.....	23
4.2.2 Generalized Westergaard Model.....	24
4.2.3 Finite-Element Incompressible Fluid Model	25
4.2.4 Frequency-Domain Compressible Fluid Model.....	26
4.2.5 Time-Domain Compressible Fluid Model	28
4.3 Water Compressibility and its Effects	31
4.4 Treatment of Model Boundary Conditions.....	31
4.5 Determination of the Reflection Coefficient.....	32
5. FOUNDATION MODELING ISSUES.....	35
5.1 Foundation Models and Earthquake Input.....	36
5.1.1 Standard Finite-Element Foundation Model.....	36
5.1.2 Massless Foundation Model	37
5.1.3 Homogeneous Viscoelastic Foundation Model	39
5.2 Future Development.....	42
5.3 Dam-Foundation Interface Forces	42

5.4	Interaction with Other Disciplines and Specialists	43
6.	EVALUATION OF SEISMIC PERFORMANCE	45
6.1	Loading Conditions.....	45
6.1.1	Response Spectra	45
6.1.2	Time History	45
6.2	Failure Modes	47
6.3	Performance Criteria.....	47
6.4	Comparing Results from Different Analysis Techniques.....	50
7.	CONCLUSION.....	51
